

A dedicated router is needed for fiber optic connections

Overview

The answer is actually no—fiber optic equipment differs significantly from cable setups. Not all routers can handle fiber. A standard router may be enough for small to medium homes, but larger homes or those with complex layouts (say, houses with thick walls or multiple floors) can benefit from fiber-ready routers. Additionally, you'll need a compatible. A fiber-optic connection is the best choice for fast home internet as it has a number of advantages compared to traditional copper cables, such as faster speeds and less interference. This equipment converts data into light pulses so they can travel down the fiber-optic cable's glass tubes, where a second ONT converts. For fiber, your router needs the right WAN connection, speed support, and Wi-Fi capabilities. Your router must have a Gigabit Ethernet WAN port to connect to the ONT. Routers designed for DSL (which uses phone line inputs) or cable (which uses coaxial inputs) won't work.
