

Adding network segments to the core switch

Overview

Network segmentation with switches involves dividing a network into smaller, isolated segments to enhance security, improve performance, and simplify management. Learn how to configure a switch for network segmentation effectively by using VLANs, subnetting, and access control lists (ACLs). But here's the kicker: you don't need to overhaul your entire infrastructure to achieve this. In fact, with the right approach, you can create isolated, secure, and. This client has the typical network architecture with a pair of 6500s acting as CORE switches and the rest of access switches directly connected to these devices - COLLAPSED DISTRIBUTION/CORE - END-to-END vlans. We are planning to introduce distribution switches to migrate the L2 boundary to those. In network communication, the interconnection between different network segments is crucial. This is because only a direct route is generated for the VLANIF interface's IP. I'm at the start of a project, of which we are using consultants to help redesign our network - we're looking to simplify where possible and introduce some level of segmentation.
