

Application Selection of Optical Modules

Overview

Data Centers: Optical modules enable high-speed data transfer between servers and storage systems, supporting cloud computing and big data analytics.

Telecommunications: They form the backbone of internet service providers' networks, facilitating long-distance and high-capacity data. Integrated circuits and reference designs help you create a smaller and faster optical module design used in high-bandwidth data communication applications. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. The Transmitter Optical Sub Assembly (TOSA) is responsible for the emission of light. Its primary function entails converting electrical signals into optical signals. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. Optical modules are pivotal components in optical fiber communication systems, operating at the physical layer—the foundational level of the OSI model. These modules are typically plugged into network equipment such as. At present, the world's AI large-scale models have been released one after another and combined with industry applications to promote the smart upgrade of thousands of industries, and continue to drive the demand for optical chips, optical devices, and optical module in the upstream of the data. Any optical module has two functions of sending and receiving, performing photoelectric conversion and electro-optical conversion, so that the optical modules are inseparable from the devices at both ends of the network. Nowadays, there are often tens of thousands of devices in a data center.
