Overview

There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. Making the right decision can save costs, improve performance, and future-proof your infrastructure. In this comprehensive guide, we'll break down: What is single mode fiber?

What is multimode fiber?

Along the. Unlike copper cables, which rely on electrical signals, fiber optics use pulses of light to transmit data—offering unmatched bandwidth, low interference, and long-distance capabilities. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types. This guide explains single mode and multimode optical fiber differences in structure, distance, cost, transfer speed, types of connectors, and of widely used network standards, so that you can have a better knowledge and confidently make a decision on which Fiber fits your application requirements.
