

# Cold-fitted joints installed in the wall

## Overview

Cold joints in basement walls are weak seals where concrete layers meet that can leak if not treated. This article walks you through practical retrofit ideas and what to watch for on a DIY job. We keep it plain and achievable, not a blueprint. You'll encounter several waterstop options, from. A cold joint in concrete is an area or surface with a structural discontinuity caused by the delayed concrete pouring between two layers of concrete. When you say "ACI" I assume you mean ACI 318 (buildings), which is just a fraction of the 100+ codes. Cold joints are formed primarily between two batches of concrete where the delivery and placement of the second batch has been delayed and the initial placed and compacted concrete has started to set. Joints are intentionally placed in concrete structures to allow controlled pauses during construction or to connect structural elements.
