

# Cooled Enclosed Corridor of the Computer Room

## Overview

The cold corridor principle involves the delivery of cold air to the front of the server racks. When we talk about data center cooling, we mean transporting heat generated by IT equipment to the ambient air to maintain optimal temperatures and humidity levels for equipment within a data center facility. The Vertiv™ CoolLoop Thermal Wall unit is a turnkey chilled water air handling unit delivering 350-500kW cooling capacity for slab floor, gallery-side data center installations. Designed for cloud, hyperscale, and colocation facilities. 1 Hot aisle/cold aisle layout involves lining up server racks in alternating rows with cold air intakes – the fronts of servers – facing each other (the. According to the American Society of Heating, Refrigeration, and Air-Conditioning Engineers (ASHRAE), server rooms should be kept at 59 degrees F to 89. However, many experts suggest a range of 64. The top roof ceilings are available in many sizes and can fit with our RS-range server racks, fixed type or. Hot and cold aisle containment is a proven strategy to optimize airflow, reduce energy costs, and improve cooling efficiency.
