

Distribution box magnetic attraction

Overview

Magnets exert forces and torques on each other through the interaction of their magnetic fields. The forces of attraction and repulsion are a result of these interactions. The magnetic field of each magnet is due to microscopic currents of electrically charged electrons orbiting nuclei and the intrinsic magnetism of fundamental particles (such as electrons) that make up the material. Both of th.

Magnetic poles vs. atomic currentsThe field of a magnet is the sum of fields from all volume elements, which consist of small on an atomic level. The direct summation of all those dipole fields requires three-dimensional. The magnetic pole model assumes that the magnetic forces between magnets are due to near the poles. This model works even close to the magnet when the magnetic field becomes more complicate.

French scientist André Marie Ampère found that the magnetism produced by permanent magnets and the magnetism produced by electromagnets are the same kind of magnetism. Because of that, the strength of a permane.
