## Overview

at and Yasuhiro Koike, a polymer scientist at pioneered. Plastic optical fiber (POF) or polymer optical fiber is an optical fiber that is made out of polymer. Similar to glass optical fiber, POF transmits light (for illumination or data) through the core of the fiber. Its chief advantage over the glass product, other aspect being equal, is its robustness under bending and stretching. Applications POF has been called the "consumer" optical fiber because the fiber and associated optical links, connectors, and installation are all inexpensive. Due to the attenuation and distortion characteristics of PMMA fiber. Traditionally, (acrylic) comprises the core (96% of the cross section in a fiber 1mm in diameter), and fluorinated polymers are the material. Since the late 1990s much higher performance graded-index (GI-P.
