

Guiding fiber optic cable laying radius

Overview

The normal recommendation for fiber optic cable is the minimum bend radius under tension during pulling is 20 times the diameter of the cable (d). Proper bend radius control ensures the integrity of optical performance and protects the glass. The correct bend radius calculation is a fundamental prerequisite for high-quality fiber optic installations and is decisive for long-term network performance and reliability. While installers are aware of the fundamental importance of minimum bend radii, they often lack the practical know-how to. Every Belden cable has an installation minimum bend radius value. After the cable has been installed, and the pulling tension removed, the cable may be bent to a radius no smaller than the long term application. Ignoring the minimum bend radius for fiber optic cable can result in signal loss, increased attenuation, and long-term reliability issues.
