

How to get the USB port on a network cabinet

Overview

Install the hardware USB hub and connect it to your router using an Ethernet cable. Follow the manufacturer's instructions to complete the setup, which usually involves configuring the hub via a web interface. This saves time and increases. By converting your USB drive into a network, you can create a mini file-sharing system that eliminates the need for constant plugging and unplugging of devices. Whether you want to share files between your laptop and desktop, or enable multiple devices in your home or office to access the same. Most routers allow you to connect a USB storage device directly to the USB port. That storage device will then be visible on the network, a bit like a very basic NAS. There aren't usually a whole lot of limitations on what you can use, but the router can only deliver 15 watts out of a regular USB. A network USB hub offers a centralized point of control, making it easier to monitor and manage connected USB devices from a unified interface, reducing the need for individual device management.
