

Improve excess length of indoor tightly wrapped optical cables

Overview

The pulling length of the optical cable at one time should generally be less than 1000m. When the distance is exceeded, segmental traction or auxiliary traction should be added at the middle position to reduce cable tension and improve construction efficiency. Buy a \$5k fiber terminator tool so you can make custom length □□□□ Coil the excess into a loop no smaller than 4-5 inches diameter and Velcro tie Gently coil and use a cable tie or velco strap to keep it neat. Traditional methods can slow down your operations and increase the. Fiber optic network optimization has become a key task to ensure efficient operations with the ever-growing demand for data transmission and the increasing need for high-speed, low-latency connectivity. Laying of indoor optical fibers In order to prevent sagging or slipping, the optical cables must be firmly fixed at the top, bottom. Fiber optic cables have Kevlar aramid yarn or a fiberglass rod as their strength member. You should pull on the fiber cable strength members only! Never exceed the maximum pulling load rating. On long runs, use proper lubricants and make sure they are compatible with the cable jacket.
