

Laos Bit Error Rate Event Blind Zone 1m

Overview

The packet error ratio (PER) is the number of incorrectly received data packets divided by the total number of received packets. A packet is declared incorrect if at least one bit is erroneous. The expectation value of the PER is denoted packet error probability p_p , which for a data packet length of N bits can be expressed as
$$p_p = 1 - (1 - p_e)^N = 1 - e^{-N \ln(1 - p_e)}$$
 assuming that the number of bit errors is the number of received of a over a that. As an example, assume this transmitted bit sequence: 1 1 0 0 0 1 0 1 1 and the following received bit sequence: 0 1 0 1 0 1 0 0 1, The numbe. In a communication system, the receiver side BER may be affected by transmission channel,,, problems,, wireless , etc. The BER m. The BER may be evaluated using stochastic () computer simulations. If a simple transmission and model is assumed, the BER may also be calculated analytically. BERT or bit error rate test is a testing method for that uses predetermined stress patterns consisting of a sequence of logical ones and zeros generated by a test pattern generator.
