

Multimode pigtail identification

Overview

Fiber Optic Pigtails are divided into single-mode and multimode types, which can be distinguished by color, wavelength, and transmission distance. They are the bridge between fiber optic cables in the field and the equipment or patch panels that manage them. Get the wrong connector type, the wrong polish, or skip proper fusion splicing technique—and you're looking at elevated signal loss, increased back reflection, and a. Thorlabs' light-emitting diodes (LEDs) are pigtailed with multimode (MM) fiber and are available at visible or NIR spectral ranges with center wavelengths from 470 nm to 810 nm. Based on Ø9 mm TO-packaged diodes, these LEDs feature either Ø400 µm core MM fiber (Item # suffix S04) or Ø1000 µm core. Fiber optic pigtails play a critical role in modern optical networks, serving as the interface between optical fibers and active or passive devices through fusion splicing. Multimode pigtails consist of 62. To classify them further, they can be subdivided into OM1 to OM5.
