

No UPnP in the telecom fiber optic router

Overview

Login to your router — access the admin panel. Find UPnP settings — look under "Advanced", "NAT", or "Administration". Enable or disable — toggle UPnP on or off based on your needs. For more information, see Apple — Universal Plug and Play (UPnP) allows devices on your network to automatically open ports and communicate with each other without manual configuration. Common use cases include online gaming, media streaming, and peer-to-peer applications. It's convenient for gaming and smart home devices, but it can be a security risk. UPnP is crucial for facilitating a smooth online experience. If the compatibility test fails with this message "No UPnP Devices found", then there are probably two possible reasons for it: UPnP is disabled by default in your home router settings.
