

# Noisy noise from the distribution box door

## Overview

This low-level hum is caused by the slight vibration of electrical currents or magnetic fields within components like transformers or the main breaker. If the sound is only audible when standing directly next to the panel and remains constant, it is not a cause for immediate alarm. These types of doors not only offer noise reduction, but also provide a more efficient and cost-effective. Hearing a new or louder-than-usual sound coming from your circuit box?

That's not something to brush off. Identifying the type of sound can help you get ahead of a potential problem. • Loose bolts, current transformer mounting, doors, covers and similar parts can resonate with the normal 60-cycle hum and. Distribution boards are crucial to any building's electrical system. However, like any other component of an electrical system, distribution boards can develop issues over time. Larson Davis offers a range of advanced noise monitoring solutions that help address these noise challenges efficiently and effectively.
