

Optical module interface is blackened

Overview

Overheating is a common fault in optical fiber modules that can be caused by excessive power, poor ventilation, or ambient temperature. The working rate, duplex mode, and negotiation mode of the two ends of the optical interface are different. The port does not match the. An optical module is a critical component in modern optical communication systems, directly affecting transmission stability, network reliability, and operational efficiency. Therefore, understanding common optical module. First, the transmission class of the optical module fault investigation and solution method This type of optical module failure mainly includes port not UP, port status is UP but do not receive or send messages, port frequently up or down and CRC error. Check compatibility between the optical module and switch Most switch brands have specific compatibility requirements. Run the display interface transceiver command on the switch to check whether any alarm information has been generated for the optical module.
