

Photoelectric converter single-mode optical module

Overview

It is an optical module based on the QSFP28 (Quad Small Form-factor Pluggable 28) package, mainly used to achieve a high-speed photoelectric conversion function, which designed to meet the growing demand for high-bandwidth network communication. The 1G optical module is already a very mature series of products, which are favored by the majority of users since its advantages of low power consumption, small size, long transmission distance, and low price. Describes what an optical module is and FAQs, including the fundamentals, appearance and structure, key performance counters, common types, and naming conventions of optical modules, causes of optical module failures and corresponding protection measures, types of optical modules supported by. Singlemode Fiber Optic Transmitters, Receivers, Transceivers are available at Mouser Electronics. Its function is to perform photoelectric conversion and electro-optical conversion. the transmitting end of the optical module converts the electrical signal into an optical signal, and the receiving end converts the optical signal into an electrical signal.
