

Recommended wide-temperature industrial-grade switches

Overview

Bimetallic switches typically cover -50°C to 300°C , ideal for HVAC, appliances, and general machinery. In general, semi-commercial or commercial-grade network switches are designed to operate within a temperature range of approximately 0°C to 45°C (32°F to 113°F). This wide temperature design ensures that the switch can still work normally in extreme environments, whether it is a hot desert, a cold. Industrial switches are designed to operate in extreme environments, including both very high and very low temperatures. The maximum temperature range for industrial switches typically spans from -40°C to $+75^{\circ}\text{C}$ (-40°F to $+167^{\circ}\text{F}$), although some specialized models can operate in even broader. By leveraging industrial-grade Ethernet switches that are designed and built to withstand extreme conditions, organizations can build redundant networks that will operate regardless of location. Thermistors offer precise control.
