

Relay protection device stuck

Overview

A stuck relay output is most commonly caused by welded contacts, output module failure, or external backfeeding. Systematic electrical and physical testing, as outlined above, will isolate the root cause. The connected device stays powered continuously. Last updated: April 22, 2026 | 10 min read Welded Contacts High inrush current. I have an issue regarding the Easergy P3U30 Protection relay. After adding said event, it prompted me to restart now or restart when the device is not working, I chose to restart when the device is not working. This can lead to all sorts of problems, from equipment malfunctions to total system failures. This can result in the relay being stuck in either the open or closed position, causing issues with the circuit it. How do you diagnose a stuck relay output that does not turn OFF even after removing the command in logic?

To diagnose a relay output that remains ON (stuck) even after the command is removed from the logic, follow this structured approach: 1. Verify Logic and Output Command Check PLC/Controller.
