

# Requirements for grounding steel in distribution boxes

## Overview

According to the 2008 NEC Handbook, "Sections 250. 4(A) and (B) 'General Requirements for Grounding and Bonding' set forth in detail what must be accomplished by the grounding and bonding of metal parts of the electrical system. The secondary side is solidly grounded and connected with MV grounding. A ground of all overhead line distribution equipment is always grounded and bonded to cont all be consider as a priority, if not available, then 70 mm2 copper conducto r normal soil condit. In industrial and civil circuit wiring, the stainless steel monitor enclosure device serves as the physical casing for various switches and control components. The equipotential bonding of its metal casing is the underlying logic that ensures the reliable operation of the system. For field. Today, we're diving deep into the world of distribution box grounding, breaking down the standards, and shining a light on those sneaky mistakes that even experienced electricians sometimes make. Each DISTRIBUTION BOX and controller must be grounded. During fault conditions, low impedance results in high fault current flow, causing overcurrent protective. IPMENT, STRUCTURES, ETC. IN ELECTRICAL STATIONS INCLUDING TRANSMISSION AND DISTRIBUTION SUBSTAT GR THAN 8 FT FROM THE FENCE. THE FENCE SHALL BE GROUNDED SEPARATELY FROM THE GRID UNLESS OTHERWISE NOTED ON THE A PROPRIATE PROJECT DRAWING.
