

Requirements for standard single-mode optical cable splicing

Overview

12 specifies splices of single-mode and multimode optical fibres. It describes suitable procedures for splicing that should be carefully followed in order to obtain reliable splices between single optical fibres or ribbons. The optical fibres are those described in IEC 60793-2-50. To minimize reflection loss caused by an air gap between the fibre ends, index-matching material can be used. 01-SDMS-01 (latest revision) titled "General Requirements for all Equipments/ Materials", which shall be considered as. For the purposes of this paper, we have defined the following terms: Cable • section – a single cable length with a joint at each end; Span • – the network between optical amplifiers, comprising several cable sections and their associated joints; Link • – the optical network between. ignificantly to splice loss in single-mode fiber. The typical specification for core-clad concentricity i today's G.
