

Should cable trays be sleeved when passing through walls

Overview

Where cables pass through shafts, walls, slabs, or enter electrical panels or cabinets, openings shall be tightly sealed with firestopping materials in accordance with design requirements. Scope: Firestopping for busway, cable trays, cables, and trunking passing through walls in enclosed electrical installations. A fire can spread rapidly through a building where permanent openings are present and especially where flammable. Cable trays should not pass through a fire rated wall because the metal tray can conduct heat through the wall and may ignite materials on the other side. The last part of our penetration seal series of articles. This publication is intended as a practical guide for the proper and safe* installation of cable ladder systems, cable tray systems, channel support systems and associated supports.
