

Single-mode module and multi-mode pigtail can be connected

Overview

To realize the short-range direct connection to the end B switch with the same port, the same 10GBASE-SR SFP+ module should be plugged into the end B switch port. Then use a multimode fiber to connect the two ends. This is the most ideal and simple application scenario. These differences determine which transceivers work with which fiber and how far signals can travel. Single-mode. Single fiber modules (BiDi) use one fiber for both transmitting and receiving data. They use a thin fiber. Understanding the differences between single-mode and multi-mode fiber pigtails is crucial for selecting the right type for data centers, telecommunications, FTTH (Fiber to the Home) installations, or enterprise networks. Typically, single mode SFP modules are labeled as "SM" or "single mode," while multimode modules may be labeled as "MM" or "multimode."
