

Switching between the A and B ends of a single-mode fiber optic transceiver

Overview

Key Up connectors are used at both ends to achieve transceiver-receiver flipping, so that the fiber at position 1 (Tx) goes to position 12 (Rx) at the other end, the fiber at position 2 (Rx) goes to position 11 (Tx) at the other end, and so on. A fiber media converter takes an Ethernet signal on copper (RJ-45) and converts it to an optical signal on fiber, or vice versa. There are also fiber-to-fiber versions that translate between different fiber types, wavelengths, or distances. Common families support 10/100/1000 Ethernet and. Fiber optics relies on a bidirectional transmission where the transmitter port on one end connects to the receiver port on the other end. Since fiber optic links require a two-way - or duplex - connection, there is potential for errors in installation by connecting transmitter to transmitter or. The three methods defined by the TIA 568 standard to ensure the correct polarity of optical fibers are named Method A, Method B, and Method C. For duplex transmission, this is relatively straightforward to accomplish.
