

# The Composition of Internet Data Centers

## Overview

Data centers are physical computing resources that allow organizations to operate their websites or digital offerings 24/7. Data centers are generally made up of racks (servers are stacked with each other), cabinets, cables, and many more. Maintaining a data center requires a significant amount of. This is where Data Center Infrastructure Management (DCIM) comes in. DCIM software offers a unified view of both IT and facility components. Data center components form the backbone of modern IT operations, supporting compute, connectivity, storage, power, cooling, and security functions. Organizations evaluating a colocation data center deployment or managing their own enterprise data center must assess each component's role in. A data center is a facility used to house computer systems and associated components, such as telecommunications and storage systems. It is a climate-controlled, access-restricted space designed to maximize compute density while maintaining optimal operating conditions.
