Overview

Fiber-optic switches are optical switches in the context of fiber optics. The simplest device is an on/off switch with one input and one output, which allows light to pass with low insertion loss when open, and blocks it completely (or at least causes high insertion loss) when. Fiber-optic switches control light paths within fiber optics, ranging from simple on/off types to complex matrix configurations like 64×64. They are used in a wide range of applications, including telecommunications, data centers, industrial automation, and military and aerospace. Unlike traditional electrical switches, which process data via copper-based transmission, fiber optic variants utilize light signals to improve data integrity, speed, and resistance to electromagnetic. Optical fiber switches are devices that enable data transfer between servers by connecting them through fiber optic cables.
