

The minimum bend angle of the pigtail fiber is how many degrees

Overview

The fiber optic 90-degree bend refers to the minimum radius required when cables must change direction at right angles. Similar to how a garden hose restricts water flow when kinked, fiber optic cables experience performance degradation or complete signal loss when bent too sharply. While installers are aware of the fundamental importance of minimum bend radii, they often lack the practical know-how to. The normal recommendation for fiber optic cable is the minimum bend radius under tension during pulling is 20 times the diameter of the cable (d). 75dB (at 1550 nm) increase in one turn. 657 Class A2 fibers are specified for a minimum bend radius of 7. Proper bend radius control ensures the integrity of optical performance and protects the glass. Max bend radius is 180 degrees, any further then that and the bend starts to go to 179 and down! That's what my brain was telling me, but then I see this <https://a.co/d/cpjAApH> Nominal Outer Diameter (mm)4.
