

The principle for setting up primary distribution boxes is

Overview

The principle of "one machine, one switch, one leakage, one box, one lock" strictly prohibits the same switchgear from directly controlling two or more electrical devices (including sockets). Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers. At this. The terms primary, secondary, and tertiary distribution boxes are relative. From the transformer's low-voltage side (0. 4kV), power is distributed to a main distribution panel. The primary cabinet adopts lower incoming and lower outgoing lines, and the front door is opened. The main bus is connected by copper bar, with good contact. 4kV to the distribution cabinet (primary distribution cabinet), then the outgoing line is led to the distribution box (secondary distribution box) in each building, and finally the outgoing line is led to the distribution cabinet. A distribution box, also known as a distribution board, electrical panel, or breaker box, is an enclosure that houses electrical components responsible for distributing electricity throughout a building. They also include metering systems, ensuring.
