

Theoretical weight of cable trays and trunking

Overview

This tool estimates tray self-weight from material density and an approximate metal volume. For solid and perforated trays, it treats the tray as a formed sheet: Developed sheet width per meter: $Dev = W + 2H + 2R$ Metal volume per meter: $V = Dev \times t \times 1 \times (1 - Open\%)$. In this guide, we'll walk you through the step-by-step process for calculating cable tray weight, while providing examples for both channel trays and ladder trays. Export results instantly for schedules, submittals, and field checks. Density values are typical engineering references. All illustrations, descriptions and technical information included in this document are provided as indications and can cable trays are equivalent. The mechanical and electrical characteristics, tests, certifications, overall quality management, recommendations mentioned. In this guide, you will learn how to calculate cable tray size step by step using a practical formula, tray selection rules, and a real example. Save your cable tray sizing calculator results as branded PDF. Calculate the correct cable tray or trunking size with BS 7671 space factor compliance, cable segregation warnings, and support spacing recommendations.
