

Transmission distance of PON optical module

Overview

While standard EPON and GPON networks support transmission distances up to 20 km, the actual reachable distance depends on optical budget, splitter loss, fiber attenuation, and equipment capabilities. Proper planning ensures reliable service delivery without signal degradation. This article explores the transmission distance limits in. Wavelength Support: Utilizes 1490 nm for downstream and 1310 nm for upstream transmissions. GPON optical modules are classified based on several industry standards and specifications. Operating on a passive optical network architecture, these modules eliminate the need for active. According to equation 1, the transmission limited distance L of the PON can be calculated. Currently, GPON is evolving towards XG-PON, which commonly uses Combo optical modules. According to the. GPON meets the needs and characteristics of a gigabit network and can initially accommodate up to 64 ONTs (split ratio 1:64) per OLT port at a distance of up to 20 km.
