

Uses of PBT optical cables

Overview

PBT Tube Optical Fiber Cable is a type of fiber optic cable that is designed for applications that require high-speed data transmission over long distances. Polybutylene Terephthalate (PBT) is a semi-crystalline thermoplastic engineering polymer, synthesized through esterification and polycondensation of dimethyl terephthalate (DMT) or terephthalic acid (TPA) with butanediol. These materials are strategically employed to fortify and shield the delicate optical fibers within the cable. We combine global scientific leadership in specialty elastomers, engineering resins, and additives with unmatched. Today, we want to shed light on the exceptional qualities of PBT (Polybutylene Terephthalate) as a crucial material for fiber optics. As a leading manufacturer of modified plastic pellets, TOPONEW takes immense pride in introducing PBT as a high-viscosity, extrusion-grade resin with low carboxyl. Optical cables play a key role in this trend, and optical cable-grade PBT, as a type of optical cable material, will benefit from the growth of the optical communications market. What is the difference between ordinary PBT and optical cable grade PBT?

PBT is generally required to have an intrinsic.
