

Working Principle of PLO Insertable Optical Splitter

Overview

PLC optical splitters are based on planar lightwave circuit technology, which uses a silica-based waveguide to split the optical signal. The split ratio and insertion loss are two key parameters defining their performance. A deeper understanding of these. The Asia Pacific region (APAC) leads worldwide consumption of Planar Lightwave Circuit (PLC) splitter compact devices with a 68% share, followed by the Americas and the EMEA (Europe, Middle East, and Africa) region. The global PLC Fiber Optic Splitter market was valued at \$4. 47 Billion USD in 2020. PLC optical splitters (planar waveguide optical splitter) is a key component in optical fiber communication networks and is widely used in optical fiber distribution systems such as FTTH (fiber to the home) and PON (passive optical network). This article provides a comprehensive understanding of PLC splitters, including their working principle, types, advantages, deployment. Bandwidth is shared amongst customers in a PON, and the bandwidth received by a customer is not related to the power received at the optical network terminal (ONT) as long as the power is high enough so the ONT can operate. Splits are most commonly factors of 2, such as 1x2, 1x4, 1x8, 1x16, 1x32.
